

ENGG1003 - Friday Week 5

Arrays and Functions: Together at Last!

Does anyone even read the title page?

Also: Maybe Strings

Brenton Schulz

University of Newcastle

March 28, 2019

The Story So Far

- ▶ Course summary:
 - ▶ Flow control
 - ▶ `if()`
 - ▶ `while()`
 - ▶ `for()`
 - ▶ `switch()`
 - ▶ Variables and data types
 - ▶ Functions
 - ▶ Arrays
- ▶ Today: Arrays and functions together
 - ▶ Subtext: Pointers
- ▶ Today (maybe): Strings
- ▶ Tuesday: File input-output (I/O)

Programming Assignment And Quiz

- ▶ The programming assignment will use everything from the previous slide
- ▶ The quiz can include everything up to, and including, the Week 5 Tuesday lecture
 - ▶ Held in Friday 9-10am lecture
 - ▶ Exact duration TBA
 - ▶ It will be hand written
 - ▶ Yes, *real paper*
 - ▶ Mix of:
 - ▶ Multiple choice
 - ▶ Code reading & analysis
 - ▶ Short code writing (1-3 lines)
 - ▶ You will **not** be asked to write out a whole program by hand

Arrays and Functions

- ▶ On Tuesday:
 - ▶ Studied arrays
 - ▶ Studied functions
 - ▶ Didn't mix them

Arrays and Functions

- ▶ On Tuesday:
 - ▶ Studied arrays
 - ▶ Studied functions
 - ▶ Didn't mix them
- ▶ There are two ways to pass arrays to functions:

Arrays and Functions

- ▶ On Tuesday:
 - ▶ Studied arrays
 - ▶ Studied functions
 - ▶ Didn't mix them
- ▶ There are two ways to pass arrays to functions:
 - ▶ Pass an array element, eg:

```
1 int function(int x);  
2 // ...  
3 int array[12];  
4 // ...  
5 function(array[6]);
```

Arrays and Functions

- ▶ On Tuesday:
 - ▶ Studied arrays
 - ▶ Studied functions
 - ▶ Didn't mix them
- ▶ There are two ways to pass arrays to functions:
 - ▶ Pass an array element, eg:

```
1 int function(int x);  
2 // ...  
3 int array[12];  
4 // ...  
5 function(array[6]);
```

- ▶ Give a function a *pointer* to an array
 - ▶ Ok, lets break this one down a bit...

Arrays and Functions

- ▶ Firstly: why don't we pass a whole array?

Arrays and Functions

- ▶ Firstly: why don't we pass a whole array?
 - ▶ Arrays can be *huge*
 - ▶ Passing a whole array *copies* everything
 - ▶ This is a bad idea so C doesn't support it
 - ▶ (Advanced) Arguments are put to the *stack*
 - ▶ Google stack Vs heap memory allocation for more information. This is beyond ENGG1003.

Arrays and Functions

- ▶ Firstly: why don't we pass a whole array?
 - ▶ Arrays can be *huge*
 - ▶ Passing a whole array *copies* everything
 - ▶ This is a bad idea so C doesn't support it
 - ▶ (Advanced) Arguments are put to the *stack*
 - ▶ Google stack Vs heap memory allocation for more information. This is beyond ENGG1003.
- ▶ Instead, C passes a *pointer*
 - ▶ This is the *memory address* of the array's start

Arrays and Functions

- ▶ Firstly: why don't we pass a whole array?
 - ▶ Arrays can be *huge*
 - ▶ Passing a whole array *copies* everything
 - ▶ This is a bad idea so C doesn't support it
 - ▶ (Advanced) Arguments are put to the *stack*
 - ▶ Google stack Vs heap memory allocation for more information. This is beyond ENGG1003.
- ▶ Instead, C passes a *pointer*
 - ▶ This is the *memory address* of the array's start
 - ▶ In C, the array's name is equivalent to `&name[0]`

Arrays in Memory

- ▶ Review: When we declare an array, eg,

```
1 int x[20];
```

the compiler allocates $20 * \text{sizeof}(\text{int}) = 80$ bytes to store it

- ▶ The *memory address* of $x[0]$ is some seemingly random number, p
- ▶ Other elements are stored in sequential memory addresses:
 - ▶ The address of $x[1]$ is $p + 4$
 - ▶ The address of $x[i]$ is $p + i * 4$

Arrays in Memory

- ▶ Therefore, to access any element of an array all we need is:
 - ▶ A pointer to the first element
 - ▶ Knowledge of the arrays *data type*
 - ▶ Specifically: the type's *size*

Arrays in Memory

- ▶ Therefore, to access any element of an array all we need is:
 - ▶ A pointer to the first element
 - ▶ Knowledge of the arrays *data type*
 - ▶ Specifically: the type's *size*
- ▶ So that's what we do with functions:
 - ▶ The function argument is a *pointer* to a *data type*

Arrays in Memory

- ▶ Therefore, to access any element of an array all we need is:
 - ▶ A pointer to the first element
 - ▶ Knowledge of the arrays *data type*
 - ▶ Specifically: the type's *size*
- ▶ So that's what we do with functions:
 - ▶ The function argument is a *pointer* to a *data type*
- ▶ C syntax:

```
1 return_type function_name(data_type *varName);
```
- ▶ Key syntax element: the `*` character

Arrays in Memory

- ▶ Therefore, to access any element of an array all we need is:
 - ▶ A pointer to the first element
 - ▶ Knowledge of the arrays *data type*
 - ▶ Specifically: the type's *size*
- ▶ So that's what we do with functions:
 - ▶ The function argument is a *pointer* to a *data type*
- ▶ C syntax:

```
1 return_type function_name(data_type *varName);
```
- ▶ Key syntax element: the `*` character
- ▶ Inside the function use `var[i]` syntax

Key Points

- ▶ Because arrays are passed via a pointer the function gets *the actual array*
- ▶ Modifying the array in the function modifies the original variable
- ▶ You don't *need* a return value
 - ▶ In a technically incorrect way: all the array's elements are “returned”

Example

- ▶ Write a function which zeros the first N elements of an array of `ints`
 - ▶ Function prototype:

Example

- ▶ Write a function which zeros the first N elements of an array of `ints`
 - ▶ Function prototype:
 - ▶ `void zero(int *x, int N);`

Example

- ▶ Write a function which zeros the first N elements of an array of `ints`
 - ▶ Function prototype:
 - ▶ `void zero(int *x, int N);`
 - ▶ The value of N is needed because C won't tell you how long an array is *within the context of the function*
 - ▶ (Advanced) `sizeof(x)` will just be the size of the pointer - 4, or 8 bytes

Example

► Function definition:

```
1 // Zeros first N elements of x
2 void zero(int *x, int N) {
3     int i; // Array index loop counter
4     for(i = 0; i < N; i++)
5         x[i] = 0; // Use array syntax
6     return; // Optional
7 }
```

Other Examples

- ▶ Lets write and test these live...
- ▶ Write a function which:
 - ▶ Returns the sum of an array of length N
 - ▶ Returns the maximum value in an array of length N
 - ▶ Fills an array with integers between two given numbers `min` and `max`
 - ▶ Prototype:

```
void countArray(int *x,  
                int min, int max);
```

Strings

- ▶ A *string* is the “data type” which stores human-readable text
- ▶ C does not have a `string` data type
 - ▶ Most newer languages do, though
- ▶ In C strings are stored in arrays of type `char`
 - ▶ Their “length” is defined by a terminating zero

String Syntax

- ▶ C strings are arrays of type `char`
- ▶ They are declared with normal array syntax:

```
1 char name[200];
```

- ▶ The “size” of a string is known as the *length*
- ▶ Strings get terminated with a 0
 - ▶ Ok, technically NULL but its just a zero in memory
 - ▶ Often NULL is written `\0`
- ▶ The NULL termination defines the length

Strings in Memory

- ▶ Each character is a single byte
- ▶ The terminating NULL is also a single byte
 - ▶ Be aware of this when declaring array sizes
- ▶ Everything beyond the NULL is “garbage”
 - ▶ Doesn't matter what the array size is
- ▶ The string "hello" would be stored as:

(Addresses are made up numbers)

Address:	10	11	12	13	14	15	16	17
Data:	??	h	e	l	l	o	\0	??
