ENGG1003 - Thursday Week 4

Using random numbers, and reading from spreadsheets

Steve Weller & Sarah Johnson

University of Newcastle

18 March, 2021

Last compiled: March 18, 2021 3:02pm +11:00

Lecture overview

- Using random numbers
- Reading from spreadsheets

 More practice with arrays, iteration, conditional code execution (if) and plotting

1) Using random numbers

Recap: generating random numbers

```
In [1]: import numpy as np
In [2]: np.random.randint(1, 6, 4)  # ...4 integers from [1, 6)
Out[2]: array([1, 3, 5, 3])
In [3]: np.random.random(4)  # ...4 floats from [0, 1)
Out[3]: array([ 0.79183276,  0.01398365,  0.04982849,  0.11630963])
In [4]: np.random.uniform(10, 20, 4)  # ...4 floats from [10, 20)
Out[4]: array([ 10.95846078,  17.3971301 ,  19.73964488,  18.14332234])
```

Using numpy library:

- random integers
- random floats from [0,1)
- random floats from [a, b]

Random integers: simulating coin toss

Example 1

Simulate the toss of a coin N times as follows:

- ullet generate a length-N array of randomly chosen 0s and 1s
 - ightharpoonup 0 = heads, 1 = tails
 - equally likely heads and tails ie: fair coin
- display expected number of heads observed
- display actual number of heads observed
- test/debug with N = 100, then N = 100,000

Coin toss simulation

```
import numpy as np
3 # generate random array of 0s and 1s
4 # 0==heads & 1==tails
_{5} \# N integers from [0,2) ie: 0 or 1
_{6} N = 100000
7 \times = np.random.randint(0, 2, N)
8 print(x)
_{10} headCnt = 0:
11 for i in range (0,N,1):
if x[i] == 0:
headCnt += 1
print ('Expected number of heads: \{\}'. format (N/2))
print('Observed number of heads: {}'.format(headCnt))
```

• Live demo of headsTails.py

Random floats: engineering tolerance

- steel bolts manufactured with length uniformly distributed between 17 mm and 19 mm
- only bolts with length in range [17.25, 18.75] mm are within tolerance ie: acceptable
- write Python code with random numbers to estimate percentage of bolts which are acceptable
 - demonstrate your code for N = 10,000
 - compare with expected percentage of acceptable bolts:

$$100 \times \frac{18.75 - 17.25}{19 - 17} = 75\%$$

Engineering tolerance simulation

```
import numpy as np
_3 # generate random array of N floats in range [17,19]
_{4} N = 10000
x = np.random.uniform(17,19,N)
_6 tolLow = 17.25
_7 \text{ tolHigh} = 18.75
8 #print(x)
10 \text{ goodCnt} = 0;
11 for i in range (0,N,1):
if tolLow \leq x[i] \leq tolHigh:
           goodCnt += 1
13
14
print ('Percentage of parts within tolerance: {}%'.
      format(100*goodCnt/N))
```

• Live demo of engTolerance.py

Random floats: simulate dartboard

- a circular dartboard radius 1 m is centred in the middle of a square, side length 2 m
- darts are thrown randomly and land with uniform probability in the square
 - most (but not all) darts land inside the circle

Random floats: simulate dartboard

Example 3

- a circular dartboard radius 1 m is centred in the middle of a square, side length 2 m
- darts are thrown randomly and land with uniform probability in the square
 - most (but not all) darts land inside the circle
- write a Python program which puts a red dot if the dart lands inside (or on the perimeter) of the circle, and a blue dot otherwise
 - Hint: points inside (or on perimeter) of circle satisfy

$$x^2 + y^2 \le 1$$

• run your program with N=100,1000 and 10,000

Dartboard simulation: code

```
1 import numpy as np
 2 import matplotlib.pyplot as plt
 4 \# \text{ generate random array of } (x,y) \text{ pairs covering}
 5 # square with edge length 2
 6 N = 10000
7 x = np.random.uniform(-1, 1, N) \# N floats from [-1,1]
8 y = np.random.uniform(-1, 1, N) \# N floats from [-1,1]
10 insideCnt = 0:
11 for i in range (0,N,1):
  if \times [i] **2 + y[i] **2 <= 1:
12
            plt.plot(x[i],y[i],'r.')
13
  else:
14
             plt.plot(x[i],y[i], 'b.')
15
16
plt.axis('equal') # plot with aspect ratio 1:1
18 plt.show()
```

• Live demo of dartboard.py

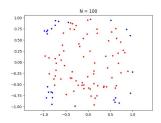

Dartboard simulation: output

ullet two length-N arrays of random numbers

$$x = [x[0], x[1], ..., x[N-1]]$$

 $y = [y[0], y[1], ..., y[N-1]]$

- $x[i] \in [-1, +1]$ for all i, similar for y[i]
- position (x_i, y_i) of *i*-th dart is (x[i], y[i])

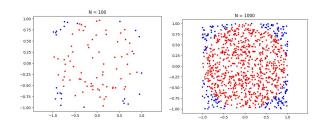

Dartboard simulation: output

ullet two length-N arrays of random numbers

$$\times = [x[0], x[1], ..., x[N-1]]$$

$$y = [y[0], y[1], ..., y[N-1]]$$

- $x[i] \in [-1, +1]$ for all i, similar for y[i]
- position (x_i, y_i) of *i*-th dart is (x[i], y[i])

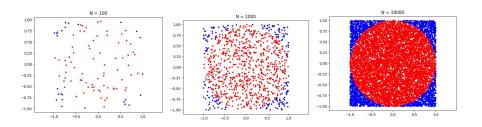

Dartboard simulation: output

ullet two length-N arrays of random numbers

$$x = [x[0], x[1], ..., x[N-1]]$$

$$y = [y[0], y[1], ..., y[N-1]]$$

- $x[i] \in [-1, +1]$ for all i, similar for y[i]
- position (x_i, y_i) of *i*-th dart is (x[i], y[i])

Random floats: estimate π

- modify Example 3 to count number of points inside (or on) circle
- ullet use your results to estimate the value of π

Random floats: estimate π

- modify Example 3 to count number of points inside (or on) circle
- ullet use your results to estimate the value of π
- strategy:
 - ightharpoonup area of square: $2 \times 2 = 4$
 - ightharpoonup area of circle: πr^2 , where radius r=1, hence area is π

$$R = \frac{\text{area of circle}}{\text{area of square}} = \frac{\pi}{4}$$

Random floats: estimate π

- modify Example 3 to count number of points inside (or on) circle
- ullet use your results to estimate the value of π
- strategy:
 - ightharpoonup area of square: $2 \times 2 = 4$
 - ightharpoonup area of circle: πr^2 , where radius r=1, hence area is π

$$R = \frac{\text{area of circle}}{\text{area of square}} = \frac{\pi}{4}$$

estimate of
$$\pi = 4 \times \text{estimate of ratio } R$$

= $4 \times \frac{\text{number of points in circle}}{\text{total number of points}}$

Estimate π : code

```
1 import numpy as np
 2 import matplotlib.pyplot as plt
 4 # generate random array of (x,y) pairs covering
 5 # square with edge length 2
 6 N = 10000
7 x = np.random.uniform(-1, 1, N) # N floats from [-1,1]
8 y = np.random.uniform(-1, 1, N) # N floats from [-1,1]
10 insideCnt = 0;
11 for i in range(0,N,1):
       if x[i]**2 + y[i]**2 <= 1:
12
          plt.plot(x[i],y[i],'r.')
13
            insideCnt += 1
14
   else
15
            plt.plot(x[i],y[i],'b.')
16
17
18 R = insideCnt/N
19 print('Estimate of pi: {}'.format(4*R))
20
21 plt.axis('equal')
22 plt.show()
```

2) Reading from spreadsheets

- so far have been working "toy problems" with small data sets
- engineers and scientists often work with large datasets
 - spreadsheets eg: CSV or XML files
 - databases eg: SQL files
 - wide range of other software packages
- there's a package for that: it's called pandas
 ...and we can import it just like numpy and
 matplotlib
 - 1 import pandas as pd

Working with Data

- To import the data is then relatively straightforward
- For a CSV file the instruction is

```
import pandas as pd
mydata = pd.read_csv('filename.csv')
```

 If the CSV file is not in the same folder as the python project you can specify its location with a path

```
import pandas as pd
mydata = pd.read_csv('c:\Myfolder\filename.csv')
```

Working with Data

- Pandas will import the contents of the spreadsheet into something called a data structure (which we won't spend any time on today but may get back to later in the course)
- To check on the data imported into 'mydata' the following instruction is very useful

```
print ( mydata . head ( ) )
```

• This prints out the first few lines of the data set

Working with Data

 One final very useful instruction will extract a column of the data and save it as a numpy array using the column name in the original spreadsheet

```
mycolumn = mydata['column_name'].values
```

 We can now process this data using the python skills we have been building in this course

Example

 We have a csv spreadsheet (Rainfall.csv) which records annual rainfall for 20 regions over the last 10 years

 We would like to know how many regions have seen a reduction in rainfall between 2010 and 2020

```
import pandas as pd

# import the rainfall data
Rainfalldata = pd.read_csv("Rainfall.csv")
print(Rainfalldata.head())

# extract the columns for 2010 and 2020
Rainfall2010 = Rainfalldata['Rainfall 2010'].values
Rainfall2020 = Rainfalldata['Rainfall 2020'].values
```

```
1 # How many regions have seen a decrease in rainfall
_{2} N = len (Rainfall2010)
3 count = 0
4 for i in range (0, N, 1):
      if Rainfall2020[i] < Rainfall2010[i]:</pre>
          count = count + 1
 percentage_decreased = count/N*100
print('Of the {} regions, {} have reduced rainfall
     which is {:f6.2}% '.format(N, count,
     percentage_decreased))
```

Lecture summary

- Using random numbers
- Reading from spreadsheets

 Next lecture: functions in Python, Chapter 4 of LL textbook
